

PUFF × **JEROME BAKER**
pre-rolls DESIGNS

THE PRE-ROLL THAT COMES IN GLASS

A hand-blown Jerome Baker tube for the Puff one-gram – the same format, the same wordmark up the side, in a vessel that outlives the joint.

CONCEPT PACK

CALIFORNIA + NEW YORK

AUGUST 2026

THE PREMISE

TWENTY MILLION PRE-ROLLS. TWENTY MILLION PLASTIC TUBES.

Puff has sold more than twenty million pre-rolls. Every one of them went out in a printed plastic tube - the cheapest component in the package, and the only component the customer still has an hour later.

That tube already does the brand's hardest work. It carries the wordmark down its own axis, it sits on the counter, it comes out at the table. It is a brand asset that gets thrown away because of what it is made of - and nothing else about it needs to change.

Make that one part glass and the pre-roll stops being packaging and starts being a keepsake with a joint in it.

20M+

pre-rolls sold, on Puff's own count

THE PIECE · JBD-JT-124

THE JOINT TUBE

A straight, flat-bottomed tube in boro 3.3, blown to take a one-gram king-size cone with room to shake it back out. It stands on a counter, it stops on a table, and it is finished the way a piece of glass is finished rather than the way a component is.

Overall height	124 mm
Body	24 mm OD, 4.5 mm wall
Bore	15 mm – takes a 1 g cone
Base	7 mm, flat and closed
Glass	approx. 79 g, boro 3.3
Colourway	Puff Blue, silver fumed
Closure	tapered natural cork, 24 mm
Print	50 mm label band, up the axis

PUFF BLUE

Your blue in the body, silver fumed so it flashes as the piece turns rather than sitting flat on it.

GOLD DRIPS

A band of gold laid on at the rim and let go. It runs, thins, and beads where it stopped. No two are the same.

PINK AND GOLD WIG WAG

Stringers walked round the base while they are run up and down, stacked into chevrons. Pulled by hand.

WHY THIS GLASS

NOT A GLASS TUBE. A JEROME BAKER.

Jerome Baker Designs has been blowing glass since the nineties. The name is the point: it is the reason a customer keeps the tube on a shelf instead of in a drawer, and the reason the second one is bought without a joint in it.

The drips run where they run. Two tubes off the same bench are the same object and not the same piece - and at twenty thousand units that is not a limitation, it is the only thing plastic cannot copy.

NO TOOLING TO AMORTISE

Injection moulding wants fifty thousand units before the tool pays for itself. Glass has no tool - a ten thousand unit run is a normal run, and the second colourway costs nothing to add.

WORKED, NOT MOULDED

Boro 3.3. The body is formed to spec; the wig wag, the drips, the marbles and the mark are laid on by hand, which is what a mould cannot do at any volume.

NON PLANT-TOUCHING

The glass ships from the non-cannabis entity, so nothing about the collab touches either licence.

THE BOX

RIGID BOARD, HINGED LID, MAGNETIC CLASP.

A keepsake handed over in a paper bag is a keepsake nobody photographs. The lid is hinged full height and closes onto two disc magnets in the front lip. It opens with a click and closes the same way.

Outside	53 x 48 x 169 mm
Board	3.5 mm rigid, wrapped
Clasp	2 x 9 mm disc magnets
Insert	die-cut foam, one well
Relief	front-cut - lifts straight out

The lining carries the colour. Glass is transmissive, so behind a black insert the piece reads black – the insert is what it is seen against, and it is the one part of the box that is not black.

THE CONSTRAINT

TWO RULES, NOT ONE

CHILD-RESISTANT

Every route below is a stock component – a certified closure, a shrink band, a pouch. None of it is tooling. New York now asks for ASTM D3475-2024 and senior-friendly testing rather than the CPSC poison-prevention baseline alone, so “certified” has to mean certified to that.

OPAQUE

Both states require the retail package to be opaque – the product may not be visible through it. A clear tube with a joint showing cannot be the retail package in either state, and a clear CR pouch does not fix that. Something opaque has to be outside it.

ROUTE A

The box is the package

The opaque rigid box carries the opacity rule and the label; a certified CR band or closure carries the other. The glass keeps its cork and its look, and the box was in the drop anyway.

Recommended. Nothing about the piece changes.

ROUTE B

CR closure on the glass

An off-the-shelf certified CR cap replaces the cork on the loaded SKU. Stock part, not tooling. Still needs an opaque outer or an exit bag.

Cork stays on the empty SKU.

ROUTE C

CR shrink band over the cork

The cheapest mechanism, and single-use – which both states allow for a package holding one pre-roll. Also gives tamper evidence for free.

Cheapest. Still needs the opaque outer.

ROUTE D

Sold empty, alongside

An empty glass vessel is not a cannabis product: no CR, no opacity, no approval. The pre-roll ships in the existing compliant pack.

Ships to states Puff is not in yet.

Recommended: Route A with a Route C band inside it. The box makes it opaque, the band makes it child-resistant, and the piece is untouched – with Route D running alongside from day one, because it needs nothing at all.

THE TEST

TEN THOUSAND A STATE. THEN DECIDE.

Markets	California and New York
Test volume	10,000 units per state - 20,000 in total
The piece	one finish - Puff Blue, silver fumed
Allocation	by door count, not evenly
Sell-in	doors that already carry Puff, first
The read	sell-through per door over 60 days, against the same SKU in plastic
If it works	the glass tube stops being a drop and becomes what the one-gram ships in

Twenty thousand is the floor, not the ambition.

The test
10,000 / state

Programme
25,000 / state

Standard pack
100,000+ / yr

CAPACITY

CAPACITY IS NOT THE QUESTION

The body and the decoration are two different jobs, and both are already running. Twenty thousand pieces a quarter is a normal run – the line is in place, the hand-off pack is drawn, and the date is the only thing left to agree.

THE BODY

Drawn boro tubing, cut to 124, base closed flat at 7 and the rim rolled. Standard tube-shop work – runs in the tens of thousands are routine, and the hand-off pack is already drawn for a factory, in English and in Chinese.

THE DECORATION

Wig wag, drips, two marbles and the pressed mark: four passes by hand on a finished body. A staffed decorating cell does this work already – it is the part nobody can copy, and it is not the part that limits the run.

20,000

units in the test – both states

1 quarter

from sign-off to delivered

3 weeks

from sign-off to samples in hand

100k+

a year without changing anything

One piece and one finish keeps it simple all the way down: one spec on the bench, one label, one SKU on the shelf in both states.

SAY YES TO THE SHAPE OF IT, AND WE SPEC IT.

- 1 Pick a route**
A with a band in it, D alongside
- 2 Confirm the finish**
Puff Blue, silver fumed
- 3 Sign the lockup**
Puff's own artwork replaces the stand-in
- 4 Quote**
against 10,000 a state, five working days
